

Part I

Cheet Sheet

$K = \mathbb{Q}(\sqrt{d})$ where d is a square-free integer.

1. $\mathcal{O}_K = \mathbb{Z}[\alpha]$ where

$$\alpha := \begin{cases} \frac{1+\sqrt{d}}{2} & d \equiv 1 \pmod{4} \\ \sqrt{d} & d \equiv 2, 3 \pmod{4} \end{cases}$$

Theorem 1. Let A be an integral domain, and let L be a field containing A . The elements of L integral over A form a ring.

Remark. The immediate consequence of this theorem is that the ring of integers is indeed a ring.

Definition 2. Symmetric polynomials and elementary symmetric polynomials.

Theorem 3. Let A be a ring. Every symmetric polynomial $P(X_1, \dots, X_r)$ in $A[X_1, \dots, X_r]$ can be represented with a linear combination of elementary symmetric polynomials with coefficients in A .

Proof is constructive and inductive by reducing the polynomial over the lexicographically highest monomial. Not a hard proof, but the indecies are annoying.

The above proof implies:

Let $f(X) = X^n + a_1X^{n-1} + \dots + a_n \in A[X]$, and let $\alpha_1, \dots, \alpha_n$ be the roots of $f(X)$ in some ring containing A , so that $f(X) = \prod (X - \alpha_i)$ in the larger ring. Then

$$a_1 = -S_1(\alpha_1, \dots, \alpha_n), \quad a_2 = S_2(\alpha_1, \dots, \alpha_n), \quad a_n = \pm S_n(\alpha_1, \dots, \alpha_n).$$

(I'm not quite sure why this is the case. Maybe use the multi-binomial theorem.)

Thus the elementary symmetric polynomials in the roots of f lie in A . And so the theorem implies that every symmetric polynomial in the roots of $f(X)$ lies in A .

Proposition 4. Let A be an integral domain and Ω be an algebraically closed field containing A . If $\alpha_1, \dots, \alpha_n$ are the roots in Ω of a monic polynomial in $A[X]$, then every polynomial $g(\alpha_1, \dots, \alpha_n)$ in $A[\alpha_1, \dots, \alpha_n]$ is a root of a monic polynomial in $A[X]$.

Proof. Clearly,

$$h(X) := \prod_{\sigma \in \text{Sym}_n} (X - g(\alpha_{\sigma(1)}, \dots, \alpha_{\sigma(n)}))$$

is a monic polynomial whose coefficients are symmetric polynomials in the α_i , and therefore lie in A . But $g(\alpha_1, \dots, \alpha_n)$ is one of the roots. \square

With this we can prove that the above theorem. I don't quite understand few steps ...

Dedekind's Proof

Proposition 5. Let L be a field containing A . An element α of L is integral over A if and only if there exists a nonzero finitely generated A -submodule of L such that $\alpha M \subset M$ (in fact, we can take $M = A[\alpha]$, the A -subalgebra generated by α).

Proof. • Let $\alpha \in L$ be integral over A . The A -submodule $A[\alpha]$ in L is generated by $1, \alpha, \dots, \alpha^{n-1}$, thus finitely generated and clearly nonzero. $\alpha A[\alpha] \subset A[\alpha]$ also holds.

- Let M be a nonzero, finitely generated A -submodule in L such that $\alpha M \subset M$. Since M is finitely generated, there is a set of generators $v_1, \dots, v_n \in M$. From $\alpha M \subset M$ we have that

$$\alpha v_i = \sum_{j=1}^n a_{i,j} v_j$$

for some $a_{i,j} \in A$. We rewrite this system of equations

$$(\alpha - a_{i,i})v_i - \sum_{j=1, j \neq i}^n a_{i,j} v_j = 0$$

We have the matrix

$$\begin{pmatrix} (\alpha - a_{1,1}) & a_{1,2} & \cdots & a_{1,n} \\ a_{2,1} & (\alpha - a_{2,2}) & \cdots & a_{2,n} \\ \vdots & & & \vdots \\ a_{n,1} & a_{n,2} & \cdots & (\alpha - a_{n,n}) \end{pmatrix}$$

Applying Cramer's Rule we get $v_i = \frac{\det(C_i)}{\det C}$, but C_i is always 0, and at least one v_i is nonzero, so we have that $\det(C) = 0$.

But calculating the determinant of C gives us

$$\alpha^n + c_1 \alpha^{n-1} + \cdots + c_n = 0$$

as desired. □

Now take α and β integral over A and denote $\alpha M \subset M$ and $\beta N \subset N$.

1. MN is an A -submodule of L .

Dedekind's proof is much easier to understand, lol.

Integral Elements

Proposition 6. Let K be the field of fractions of A , and let L be a field containing K . If $\alpha \in L$ is algebraic over K , then there exists a nonzero $d \in A$ such that $d\alpha$ is integral over A .

Corollary 1. Let A be an integral domain with field of fractions K , and let B be the integral closure of A in a field L containing K . If L is algebraic over K , then it is the field of fractions B .

Part II

Exercise

Example 6.1. Let d be a square-free integer. Consider $A = \mathbb{Z}[\sqrt{d}]$. Show that every element of R can be written as a product of irreducible elements.

Proof. Define $N : R \rightarrow \mathbb{N}$ as $N(a + b\sqrt{d}) = |a^2 - db^2|$ where $a, b \in \mathbb{Z}$. Let $a_1 + b_1\sqrt{d}$ and $a_2 + b_2\sqrt{d}$ be two elements in $\mathbb{Z}[\sqrt{d}]$ with $a_1, b_1, a_2, b_2 \in \mathbb{Z}$, then

$$\begin{aligned} N((a_1 + b_1\sqrt{d})(a_2 + b_2\sqrt{d})) &= N((a_1a_2 + b_1b_2d) + (a_1b_2 + a_2b_1)\sqrt{d}) \\ &= |(a_1a_2 + b_1b_2d)^2 - d(a_1b_2 + a_2b_1)^2| \\ &= |a_1^2a_2^2 + 2a_1a_2b_1b_2d + b_1^2b_2^2d^2 - a_1^2b_2^2d - 2a_1a_2b_1b_2d - a_2^2b_1^2d| \\ &= |a_1^2a_2^2 - a_1^2b_2^2d - a_2^2b_1^2d + b_1^2b_2^2d^2| \end{aligned}$$

on the other hand

$$\begin{aligned} N(a_1 + b_1\sqrt{d})N(a_2 + b_2\sqrt{d}) &= |a_1^2 - db_1^2||a_2^2 - db_2^2| \\ &= |a_1^2a_2^2 - a_1^2b_2^2d - a_2^2b_1^2d + b_1^2b_2^2d^2| \end{aligned}$$

so we have $N((a_1 + b_1\sqrt{d})(a_2 + b_2\sqrt{d})) = N(a_1 + b_1\sqrt{d})N(a_2 + b_2\sqrt{d})$. Moreover, let $u \in \mathbb{Z}[\sqrt{d}]$ be a unit, then there is an element $v \in \mathbb{Z}[\sqrt{d}]$ such that $uv = 1$. Applying the function defined above, we get

$$1 = N(1) = N(uv) = N(u)N(v)$$

so $N(u) = 1$. Now suppose $N(a + b\sqrt{d}) = 1$ with $a, b \in \mathbb{Z}$. Consider

$$(a + b\sqrt{d})(a - b\sqrt{d}) = a^2 - db^2 = \pm 1$$

and therefore $a + b\sqrt{d}$ is a unit.

We have shown that N is a norm map. R is also an integral domain because if $x \in R$ is a zero-divisor, then we have $0 = N(x) = |a^2 - db^2|$, but this is impossible since d is square-free. Applying the example before, we get the desired result. \square

Example 6.2. 2.1.3. did it before

Example 6.3. Let R be a domain in which every element can be written as a product of irreducibles. Show that the following are equivalent.

1. this factorization is unique
2. if π is irreducible and π divides ab , then $\pi|a$ or $\pi|b$

Proof. Let the factorization be unique, $\pi \in R$ be irreducible and divide ab . Then $ab = \pi x$ for some $x \in R$. On the other hand, ab has a unique factorization that is the product of the factorization of a and b but must contain π .

For the other side let $p_1^{r_1} \cdots p_n^{r_n}$ and $q_1^{s_1} \cdots q_m^{r_m}$ be two factorizations of an element in R . Then p_1 divides $q_1^{s_1} \cdots q_m^{r_m}$ so p_1 divides some q_i . But q_i is irreducible, so we have $p_1 = q_i$. Induction yields the desired result. \square

Example 6.4. Show that if π is an irreducible element of a principal ideal domain, then (π) is a maximal ideal.

Proof. Assume (π) is not maximal, then there is an ideal (a) with $a \neq 1$ such that $(\pi) \subsetneq (a)$. But this implies $\pi = ra$ for some $r \in R$ that is not a unit. This is a contradiction. \square

Example 6.5. If F is a field, prove that $F[x]$ is Euclidean.

Proof. Define $\phi : F[x] \rightarrow \mathbb{N}$ as $\phi(f) = \deg(f)$. Fix two polynomials $f, g \in F[x]$. If $\deg(f) \geq \deg(g)$, then we can do polynomial division to get $f = gp + r$ where $\deg(r) < \deg(g)$. \square

Example 6.6. Show that $\mathbb{Z}[i]$ is Euclidean.

Proof. Fix two elements $x, y \in \mathbb{Z}[i]$ and write $x = a_x + ib_x$ and $y = a_y + ib_y$. It is

$$\frac{x}{y} = \underbrace{\frac{a_x a_y + b_x b_y}{a_y^2 + b_y^2}}_{=: \alpha} + i \underbrace{\frac{a_y b_x - a_x b_y}{a_y^2 + b_y^2}}_{=: \beta}$$

Set p_x to be the closest integer to α and p_y to be the closest integer to β and $p = p_x + ip_y$. Moreover, set $r = ((\alpha - p_x) + i(\beta - p_y))y$.

It is

$$\begin{aligned} r &= y(\alpha + i\beta) - y(p_x + ip_y) \\ &= y \frac{x}{y} - py \\ &= x - py \end{aligned}$$

so we got the desired representation.

Furthermore, we have

$$\begin{aligned} N(r) &= N(y)((\alpha - p_x)^2 + (\beta - p_y)^2) \\ &\leq N(y) \frac{1}{2} \end{aligned}$$

□

Example 6.7. Prove that if p is a positive prime, then there is an element $x \in \mathbb{Z}/p\mathbb{Z}$ such that $x^2 \equiv -1 \pmod{p}$ if and only if either $p = 2$ or $p \equiv 1 \pmod{4}$.

Proof. 1. Let $p = 2$, then we can simply choose $x = 1$. Now let $p \equiv 1 \pmod{4}$. With Wilson's Theorem we have

$$-1 \equiv (p-1)! \equiv 1 \cdot \dots \cdot \frac{p-1}{2} \cdot \frac{p+1}{2} \cdot \dots \cdot p \equiv \left(\left(\frac{p-1}{2} \right)! \right)^2 \cdot (-1)^{\frac{p-1}{2}} \equiv \left(\left(\frac{p-1}{2} \right)! \right)^2$$

where \pmod{p} . So choose the last expression as x and we are done.

2. If $p = 2$, then we are done. Now let $x^2 \equiv -1 \pmod{p}$. If $p \equiv 3 \pmod{4}$, we have

$$x^{p-1} = x^{4n+2} = x^{4n} x^2 \equiv -1 (x^4)^n \equiv -1 \pmod{p}$$

as $x^4 \equiv 1 \pmod{p}$. But this contradicts Fermat's Little Theorem.

□

Example 6.8. Find all integer solutions to $y^2 + 1 = x^3$ with $x, y \neq 0$.

Proof. If x is even, then $4|x^3$, so $x^3 - 1 \equiv 3 \pmod{4}$ which cannot be a square since all squares are congruent to either 0 or 1 $\pmod{4}$. So x is odd and y is even. Write $y^2 + 1 = (y+i)(y-i)$. If a prime divides $(y+i)(y-i)$, then the prime divides also their difference $2i$. So $p = 2$ up to units. But then p divides y as y was even, but this is impossible since p also divides $y+i$. □

Example 6.9. What are the primes of $\mathbb{Z}[i]$?

Proof. We have two types of primes in $\mathbb{Z}[i]$.

1. p and ip where $p \equiv 3 \pmod{4}$.
2. $a + ib$ with $a^2 + b^2 \equiv 1 \pmod{4}$ and prime.

This is because of the norm function $N(a + ib) = a^2 + b^2$. □

Example 6.10. A positive integer a is the sum of two squares if and only if $a = b^2 c$ where c is not divisible by any positive prime $p \equiv 3 \pmod{4}$.

Proof. I don't know. □

Example 6.11. $\mathbb{Z}[\rho]$ is a ring where

$$\rho = \frac{-1 + \sqrt{-3}}{2}.$$

Proof. 1. $(\mathbb{Z}[\rho], +)$ is an abelian group.

- (a) If $a_1 + b_1\rho$ and $a_2 + b_2\rho$ are elements of $\mathbb{Z}[\rho]$, then $a_1 + b_1\rho + a_2 + b_2\rho = a_1 + a_2 + (b_1 + b_2)\rho$, so the addition is well-defined.
- (b) Associativity and commutativity is inherited from the addition of integers.
- (c) The additive identity is 0.
- (d) If $a + b\rho$ is in $\mathbb{Z}[\rho]$, then its inverse is $-a - b\rho$.

2. $(\mathbb{Z}[\rho], \cdot)$ is a monoid.

- (a) If $a_1 + b_1\rho$ and $a_2 + b_2\rho$ are two elements of $\mathbb{Z}[\rho]$, then we have

$$\begin{aligned} (a_1 + b_1\rho)(a_2 + b_2\rho) &= a_1a_2 + b_1b_2\rho^2 + (a_1b_2 + a_2b_1)\rho \\ &= a_1a_2 + b_1b_2\bar{\rho} + (a_1b_2 + a_2b_1)\rho \\ &= a_1a_2 + b_1b_2\frac{-1 - \sqrt{3}}{2} + (a_1b_2 + a_2b_1)\frac{-1 + \sqrt{3}}{2} \\ &= a_1a_2 - \frac{b_1b_2}{2} - \frac{a_1b_2 + a_2b_1}{2} - \frac{b_1b_2\sqrt{-3}}{2} + \frac{(a_1b_2 + a_2b_1)\sqrt{-3}}{2} \\ &= a_1a_2 + \frac{-a_1b_2 - a_2b_2 - b_1b_2}{2} + \frac{(a_1b_2 + a_2b_1 - b_1b_2)\sqrt{-3}}{2} \end{aligned}$$

I made some mistake, but should be right.

- (b) The multiplicative identity is 1

3. Distributive law is again inherited. □

Example 6.12. 1. Show that $\mathbb{Z}[\rho]$ is Euclidean.

Proof. Fix two elements $x_1 + x_2\rho$ and $y_1 + y_2\rho$ of $\mathbb{Z}[\rho]$. We have

$$\begin{aligned} \frac{x_1 + x_2\rho}{y_1 + y_2\rho} &= \frac{x_1 + x_2\rho}{y_1 + y_2\rho} \frac{y_1 - y_2\rho}{y_1 - y_2\rho} \\ &= \frac{x_1y_1 - x_2y_2\bar{\rho} - x_1y_2\rho + x_2y_1\rho}{y_1^2 + y_2^2\bar{\rho}} \end{aligned}$$

I think this should work at the end of the day, but I'm too lazy to write it out. □

2. Show that the only units in $\mathbb{Z}[\rho]$ are ± 1 , $\pm\rho$, and $\pm\bar{\rho}$.

Chapter 1

Algebraic Numbers and Integers

Example 6.13. Show that

$$\alpha := \frac{\sqrt{2}}{3}$$

is an algebraic number, but not an algebraic integer.

Proof. First of all, α is the root of

$$X^2 - \frac{2}{9} \in \mathbb{Q}[X],$$

so it is an algebraic number.

Now assume α is an algebraic integer. Then, there is a monic polynomial $f \in \mathbb{Z}[X]$ such that $f(\alpha) = 0$. It is

$$\begin{aligned} f(\alpha) &= \left(\frac{\sqrt{2}}{3}\right)^n + a_{n-1} \left(\frac{\sqrt{2}}{3}\right)^{n-1} + \cdots + a_1 \frac{\sqrt{2}}{3} + a_0 = 0 \\ (\sqrt{2})^n + 3a_{n-1}(\sqrt{2})^{n-1} + \cdots + 3^{n-1}a_1\sqrt{2} + 3^na_0 &= 0 \end{aligned}$$

If n is odd, then $\sqrt{2}$ is not an integer, therefore, we can separate the sum into two smaller ones.

$$\sum_{k \text{ even}} 3^{n-k} a_k (\sqrt{2})^k = 0$$

and

$$\sum_{k \text{ odd}} 3^{n-k} a_k (\sqrt{2})^k = \sqrt{2} \sum_{k \text{ even}} 3^{n-k} a_k (\sqrt{2})^{\frac{k-1}{2}} = 0.$$

Both sums are divisible by 3 as 3 divides 0 and since all summands except for the very last one contains multiples of 3, they are divisible by 3, so the last summand must be divisible by 3 as well. But this cannot be. Hence α is not an algebraic integer. \square

Example 6.14. Show that if $r \in \mathbb{Q}$ is an algebraic integer, then $r \in \mathbb{Z}$.

Proof. Write $r = \frac{p}{q}$ such that $q \nmid p$ and we have

$$p^n + qa_{n-1}p^{n-1} + \cdots + q^na_0 = 0$$

q divides the whole sum, it divides all summands, but it does not divide p^n , therefore $q = 1$. \square

Chapter 2

3

Example 6.15. Let K be an algebraic number field. If $\alpha \in K$, then there is a nonzero integer $m \in \mathbb{Z}$ such that $m\alpha \in \mathcal{O}_K$.

Proof. Since α is an algebraic number, we have

$$\alpha^n + a_{n-1}\alpha^{n-1} + \cdots + a_1\alpha + a_0 = 0$$

with $a_0, \dots, a_{n-1} \in \mathbb{Q}$. So choose $m \in \mathbb{Z}$ such that $m\alpha_i$ is an integer for all i . We have

$$\begin{aligned} m^n \alpha^n + m^n a_{n-1} \alpha^{n-1} + \cdots + m^n a_1 \alpha + m^n a_0 &= 0 \\ (m\alpha)^n + m a_{n-1} (m\alpha)^{n-1} + \cdots + m^{n-1} a_1 (m\alpha) + m^n a_0 &= 0 \end{aligned}$$

so $m\alpha \in \mathcal{O}_K$. □

Chapter 3

Integral Bases

3.1 Overview

3.2 Details

Definition 7 (Trace and Norm). Let K be an algebraic number field with degree n . Then, K can be viewed as an finite-dimensional vector space over \mathbb{Q} . If $\alpha \in K$, we can define a linear operator

$$\Phi_\alpha : K \longrightarrow K, \quad v \mapsto \alpha v,$$

which may be represented by $n \times n$ matrices $A_\Phi = (a_{i,j})_{1 \leq i,j \leq n}$ by requiring

$$\alpha e_i = \sum_{j=1}^n a_{i,j} e_j, \quad a_{i,j} \in \mathbb{Q}.$$

We define trace of α by $\text{Tr}_K(\alpha) := \text{Tr}(\Phi_\alpha)$ and the norm of α by $N(\alpha) := \det(\Phi_\alpha)$.

Example 7.1. In this example, we will compute the traces and norms of some concrete algebraic number fields.

1. Let $K = \mathbb{Q}(i)$. If $\alpha = a + ib$ with $a, b \in \mathbb{Q}$, then $\text{Tr}_K(\alpha) = 2a$ and $N_K(\alpha) = a^2 + b^2$.

Proof. A basis of K is $\{1, i\}$. Then Φ_α is defined by

$$\begin{aligned} 1 + 0 \cdot i &\mapsto \alpha = a + ib \\ 0 + 1 \cdot i &\mapsto \alpha i = -b + ia \end{aligned}$$

and we may represent Φ by a 2×2 matrix

$$A_\Phi = \begin{pmatrix} a & -b \\ b & a \end{pmatrix}.$$

Therefore, $\text{Tr}_K(\alpha) = 2a$ and $N_K(\alpha) = a^2 + b^2$. □

2. Let $K = \mathbb{Q}(\sqrt{2})$. If $\alpha = a + \sqrt{2}b$ with $a, b \in \mathbb{Q}$, then $\text{Tr}_K(\alpha) = 2a$ and $N_K(\alpha) = a^2 - 2b^2$.

Proof. A basis of K is $\{1, \sqrt{2}\}$. Define Φ_α by

$$\begin{aligned} 1 + 0 \cdot \sqrt{2} &\mapsto \alpha = a + \sqrt{2}b \\ 0 + 1 \cdot \sqrt{2} &\mapsto \sqrt{2}\alpha = 2b + \sqrt{2}a \end{aligned}$$

then the matrix belonging to Φ_α is

$$A_\Phi = \begin{pmatrix} a & 2b \\ b & a \end{pmatrix}.$$

So we have $\text{Tr}_K(\alpha) = 2a$ and $N_K(\alpha) = a^2 - 2b^2$. \square

3. Let $K = \mathbb{Q}(\sqrt{5})$. If $\alpha = a + \sqrt{5}b$, then $\text{Tr}_K(\alpha) = 2a$ and $N_K(\alpha) = a^2 - 5b^2$.

Proof. A basis¹ of K is $\{1, \sqrt{5}\}$. As before, the linear operator Φ is defined by

$$\begin{aligned} 1 + 0 \cdot \omega &\mapsto \alpha = a + \sqrt{5}b \\ 0 + 1 \cdot \omega &\mapsto \omega\alpha = 5b + \sqrt{5}a \end{aligned}$$

and the matrix belonging to Φ is given by

$$A_\Phi = \begin{pmatrix} a & 5b \\ b & a \end{pmatrix}$$

hence it is $\text{Tr}_K(\alpha) = 2a$ and $N_K(\alpha) = a^2 - 5b^2$. \square

4. In more general terms, let $K = \mathbb{Q}(\sqrt{d})$ where d is a square-free integer. If $\alpha = a + \sqrt{d}b$, then $\text{Tr}_K(\alpha) = 2a$ and $N_K(\alpha) = a^2 - db^2$.

Proof. A basis of K is $1, \sqrt{d}$. Let Φ_α be a linear operator defined by

$$\begin{aligned} 1 + 0 \cdot \sqrt{d} &\mapsto \alpha = a + \sqrt{d}b \\ 0 + 1 \cdot \sqrt{d} &\mapsto \sqrt{d}\alpha = db + \sqrt{d}a \end{aligned}$$

which we may represent by a 2×2 matrix

$$A_\Phi = \begin{pmatrix} a & db \\ b & a \end{pmatrix}.$$

We have $\text{Tr}_K(\alpha) = 2a$ and $N_K(\alpha) = a^2 - db^2$ matching the results in our previous examples. \square

5. Let $\mathbb{Q}(\sqrt[3]{2})$.

Proof. \square

Lemma 8. If K is an algebraic number field, and $\alpha \in \mathcal{O}_K$ an element in its ring of integers, then $\text{Tr}_K(\alpha)$ and $N_K(\alpha)$ are in \mathbb{Z} .

Proof. Let K be an algebraic number field of degree n and fix an element $\alpha \in \mathcal{O}_K$ in its ring of integers. We define a linear operator $\Phi : K \rightarrow K$ by $v \mapsto \alpha v$. If e_1, \dots, e_n is a basis of K viewed as a vector space over \mathbb{Q} , then we may represent Φ as a $n \times n$ matrix by

$$\alpha e_i = \sum_{j=1}^n a_{i,j} e_j$$

¹The given basis is not an integral basis, but an integral basis is not required to find the field trace and field norm of an element.

for all $1 \leq i \leq n$ and $a_{i,j} \in \mathbb{Q}$. Taking the conjugates, we get

$$\alpha^{(k)} e_i^{(k)} = \sum_{j=1}^n a_{i,j} e_j^{(k)}$$

and with Kronecker delta we can write

$$\sum_{j=1}^n \delta_{j,k} \alpha^{(j)} e_i^{(j)} = \sum_{j=1}^n a_{i,j} e_j^{(k)}.$$

Now set $\Phi_A := (a_{i,j})$ □

Example 8.1. Let $K = \mathbb{Q}(i)$. Show that $i \in \mathcal{O}_K$ and verify that $\text{Tr}_K(i)$ and $N_K(i)$ are integers.

Proof. $X^2 + 1 \in \mathbb{Z}[X]$ has the root i , so i is in \mathcal{O}_K . Since the \mathbb{Q} -basis of $\mathbb{Q}(i)$ is $\{1, i\}$, we have

$$\Phi_i(a + ib) = -b + a_i$$

therefore, the matrix is

$$\Phi_i = \begin{pmatrix} 0 & 1 \\ -1 & 0 \end{pmatrix}$$

and hence its trace is $\text{Tr}_K(i) = 0$. Similary, its norm is $N_K(i) = 1$. □

Example 8.2. Determine the algebraic integers of $\mathbb{Q}(\sqrt{-5})$.

Proof. A \mathbb{Q} -basis for $\mathbb{Q}(\sqrt{-5})$ is $\{1, \sqrt{-5}\}$. Let $\alpha = x + \sqrt{-5}y \in \mathbb{Q}(\sqrt{-5})$. Then

$$\Phi_x(a + \sqrt{-5}b) = (x + \sqrt{-5}y)(a + \sqrt{-5}b) = xa - 5yb + (bx + ya)\sqrt{-5},$$

therefore,

$$\Phi_\alpha = \begin{pmatrix} x & y \\ -5y & x \end{pmatrix}$$

hence we have $\text{Tr}_K(\alpha) = 2x$ and $N_K = x^2 + 5y^2$.

If x is not an integer, then $2x$ must be, so we must have that $y^2 \equiv 3 \pmod{4}$, but this is impossible. Hence x, y are both integers, therefore, $\mathcal{O}_K = \mathbb{Z}[\sqrt{-5}]$. □

Example 8.3. 4.1.5 I'll skip this.

Example 8.4. Show that there exist $\omega_1^*, \dots, \omega_n^* \in K$ such that

$$\mathcal{O}_K \subset \mathbb{Z}\omega_1^* + \dots + \mathbb{Z}\omega_n^*.$$

Proof. Let $\omega_1, \dots, \omega_n$ be a \mathbb{Q} -basis for K . For any $\alpha \in K$, there is a nonzero integer $m \in \mathbb{Z}$ such that $m\alpha \in \mathcal{O}_K$. □

I'll skip exercises that require bilinear form for now.

Definition 9. Let K be an algebraic number field of degree n and \mathcal{O}_K be its ring of integers. We say that $\omega_1, \dots, \omega_n$ is an integral basis for K if $\omega_i \in \mathcal{O}_K$ for all $1 \leq i \leq n$ and $\mathcal{O}_K = \mathbb{Z}\omega_1 + \dots + \mathbb{Z}\omega_n$.

Example 9.1. Show that $\det \text{Tr}(\omega_i \omega_j)$ is independent of the choice of integral basis.

Definition 10 (Discriminant). Let K be an algebraic number field of degree n and $\omega_1, \dots, \omega_n$ an integral basis. The discriminant of K is defined as

$$d_K := \det \left(\omega_i^{(j)} \right)^2.$$

Proof. We show that the discriminant is well-defined. In other words, the discriminant is independent of the choice of integral basis.

Let $\omega_1, \dots, \omega_n$ and $\theta_1, \dots, \theta_n$ be two integral basis for K . □

Example 10.1. Let d be a square-free integer and consider the algebraic number field $K = \mathbb{Q}(\sqrt{d})$. The discriminant of K is

$$\Delta_K = \begin{cases} d & \text{if } d \equiv 1 \pmod{4} \\ 4d & \text{if } d \equiv 2, 3 \pmod{4}. \end{cases}$$

Proof. The ring of integers of K is $\mathbb{Z}[\alpha]$ where

$$\alpha := \begin{cases} \frac{1+\sqrt{d}}{2} & d \equiv 1 \pmod{4} \\ \sqrt{d} & d \equiv 2, 3 \pmod{4}. \end{cases}$$

We will look at each case one by one.

1. If $\alpha = 2^{-1}(1 + \sqrt{d})$, then a integral basis and its conjugate are

$$\left\{ 1, \frac{1+\sqrt{d}}{2} \right\} \text{ and } \left\{ 1, \frac{1-\sqrt{d}}{2} \right\},$$

therefore, the discriminant is

$$\Delta_K = \begin{pmatrix} 1 & 1 \\ \frac{1+\sqrt{d}}{2} & \frac{1-\sqrt{d}}{2} \end{pmatrix}^2 = \left(\frac{1-\sqrt{d}}{2} - \frac{1+\sqrt{d}}{2} \right)^2 = \left(-\frac{2\sqrt{d}}{2} \right)^2 = d.$$

2. On the other hand, if $\alpha = \sqrt{d}$, then a integral basis and its conjugate are

$$\left\{ 1, \sqrt{d} \right\} \text{ and } \left\{ 1, -\sqrt{d} \right\}$$

and hence we have

$$\Delta_K = \begin{pmatrix} 1 & 1 \\ \sqrt{d} & -\sqrt{d} \end{pmatrix}^2 = (-2\sqrt{d})^2 = 4d.$$

Conclude the stated result above. □
