Introduction

One problem of the Riemann integral is that some functions are not Riemann integratable.

Example 0.0.1 (Dirichlet function). For $[a, b] \subset \mathbb{R}$, define the Dirichlet function as

$$g : [a, b] \rightarrow \mathbb{R}, x \mapsto g(x) := \begin{cases} 1 & \text{for } x \in \mathbb{Q}, \\ 0 & \text{for } x \in \mathbb{R} \setminus \mathbb{Q}. \end{cases} \quad (1)$$

What are the properties a generalized concept of volumina should have?

1. positive valued
2. null empty set
3. monotonous
4. translationinvariance
5. normalization

Definition 0.1. Let $\mu : \mathcal{P}(\mathbb{R}^n) \rightarrow \overline{\mathbb{R}}_0^+$.

- μ is monotonous.
- μ is translationinvariant.
- μ is σ -additive.

Theorem 0.1.1 (Vitali's Theorem).

Part I

σ -algebra and measures

Chapter 1

Family of Sets

We have the following tree of inclusion. NOTATION GUIDE:

1. X as the superset
2. $\mathcal{P}(X)$ is the power set of X .
3. $A, B \in \mathcal{P}(X)$ as subsets
4. $\mathcal{R}, \mathcal{A} \subset \mathcal{P}(X)$ system of subsets

1.1 Symmetric Difference

Definition 1.1 (Symmetric difference). Let A, B be sets. The binary set operation symmetric difference is defined as

$$A \triangle B := (A \setminus B) \cup (B \setminus A). \quad (1.1)$$

In other words, $x \in A \triangle B$ implies x is either in A or B , but not in both.

Proposition 1.1.1 (Properties of Symmetric Difference). Let A, B, C, X and Y be sets. Moreover, let A_i and X_i be sets with an arbitrary non-empty index set $i \in I$. Then, the following identities hold.

1. $A \Delta B = (A \cup B) \setminus (A \cap B)$.
2. $(A \Delta B) \Delta C = A \Delta (B \Delta C)$. (Symmetric difference is **associative**.)
3. $A \Delta B = B \Delta A$. (Symmetric difference is **commutative**.)
4. $A \Delta \emptyset = A$ and $A \Delta A = \emptyset$
5. $(A \Delta B) \cup C = (A \cup C) \Delta (B \cup C)$.
6. $A \cap B = \emptyset \Rightarrow A \Delta B = A \cup B$.
7. $B \subset A \Rightarrow A \Delta B = A \setminus B$.
8. $X \cap Y = \emptyset \Rightarrow A \cap B \subset (X \Delta A) \cup (Y \Delta B)$.
9. $(\bigcup_{i \in I} X_i) \Delta (\bigcup_{i \in I} A_i) \subset \bigcup_{i \in I} (X_i \Delta A_i)$

1.2 Ring of Sets

Definition 1.2 (Ring of sets). There are two equivalent definitions. Let X be a set and $\mathcal{R} \subset \mathcal{P}(X)$ a system of subsets. Then \mathcal{R} is a **ring of sets over X** , if

1. the following axioms are met.
 - (a) $\mathcal{R} \neq \emptyset$ (\mathcal{R} is **nonempty**.)
 - (b) $A, B \in \mathcal{R} \Rightarrow A \setminus B \in \mathcal{R}$ (\mathcal{R} is **closed under relative complement**.)
 - (c) $A, B \in \mathcal{R} \Rightarrow A \cup B \in \mathcal{R}$ (\mathcal{R} is **closed under finite unions**.)
2. $(\mathcal{R}, \Delta, \cap)$ is a ring in the algebraic sense, with Δ as addition and \cap as multiplication.

Remark. Since we have the identity $A \cap B = A \setminus (A \setminus B)$, the condition that \mathcal{R} is closed under the relative complement, i.e.

$$A, B \in \mathcal{R} \Rightarrow A \setminus B \in \mathcal{R} \quad (1.2)$$

can be replaced with closure under finite intersection, therefore

$$A, B \in \mathcal{R} \Rightarrow A \cap B \in \mathcal{R}. \quad (1.3)$$

1.3 Algebra of Sets

Definition 1.3 (Algebra of sets). There are two equivalent definitions. Let X be a set and $\mathcal{R} \subset \mathcal{P}(X)$ a system of subsets. Then \mathcal{A} is a **algebra of sets over X** ,

1. if \mathcal{A} is a **ring of sets** that contains X , or
2. if the following axioms are met
 - (a) $\mathcal{A} \neq \emptyset$ (\mathcal{A} is **nonempty**.)
 - (b) $A \in \mathcal{A} \Rightarrow A^c \in \mathcal{A}$ (\mathcal{R} is **closed under the absolute complement**.)
 - (c) $A, B \in \mathcal{A} \Rightarrow A \cup B \in \mathcal{A}$ (\mathcal{R} is **closed under finite unions**.)

1.4 σ -Ring

Definition 1.4 (σ -Ring). Let Ω be set and $\mathcal{R} \subset \mathcal{P}(\Omega)$ a system of subsets. \mathcal{R} is a σ -ring over Ω , if

1. $\mathcal{R} \neq \emptyset$.
2. $A, B \in \mathcal{R} \Rightarrow A \setminus B \in \mathcal{R}$
3. $A_1, A_2, A_3, \dots \in \mathcal{R} \Rightarrow \bigcup_{k=1}^{\infty} A_k \in \mathcal{R}$

1.5 σ -Algebra

Definition 1.5 (σ -algebra). Let Ω be set and $\mathcal{A} \subset \mathcal{P}(\Omega)$ a system of subsets. \mathcal{A} is a σ -algebra over Ω , if

1. $\mathcal{A} \neq \emptyset$.
2. $A \in \mathcal{A} \Rightarrow A^c \in \mathcal{A}$
3. $A_1, A_2, A_3, \dots \in \mathcal{A} \Rightarrow \bigcup_{k=1}^{\infty} A_k \in \mathcal{A}$

Example 1.5.1. Trivial examples for the above structures.

Example 1.5.2. Let

$$\mathfrak{Q}(\mathbb{R}) := \left\{ \bigcup_{i=1}^m [a_i, b_i) \mid m \in \mathbb{N}; a_i, b_i \in \mathbb{R} \right\} \quad (1.4)$$

be the set of all unions of finitely many right half open intervals on \mathbb{R} . Then, $\mathfrak{Q}(\mathbb{R})$ is a set of rings. Similar for the left half open sets, but not for open or closed intervals! $\mathfrak{Q}(\mathbb{R})$ is neither σ -ring, σ -algebra nor an algebra of sets. One can generalize this to higher dimensions.

Definition 1.6. Let $\mathcal{E} \subset \mathcal{P}(\Omega)$ be a system of sets. Define

$$\mathcal{F}(\mathcal{E}) := \{ \mathcal{A} \subset \mathcal{P}(\Omega) \mid \mathcal{E} \subset \mathcal{A}, \mathcal{A} \sigma\text{-Algebra} \} \quad (1.5)$$

$$\langle \mathcal{E} \rangle^\sigma := \sigma(\mathcal{E}) := \bigcap_{\mathcal{A} \in \mathcal{F}(\mathcal{E})} \mathcal{A} \quad (1.6)$$

The first is the family of all σ -algebras that contain \mathcal{E} . The second is the smallest σ -algebra that contains \mathcal{E} .

1.6 Monotone Class

Definition 1.7 (Monotone class). Let $\mathcal{M} \subset \mathcal{P}(\Omega)$ a system of sets and $k \in \mathbb{N}^*$. Then, \mathcal{M} is a monotone class, if

1. Let $X_k \in \mathcal{M}$ with $X_k \uparrow X$, then $X \in \mathcal{M}$.
2. Let $Y_k \in \mathcal{M}$ with $Y_k \downarrow Y$, then $Y \in \mathcal{M}$.

Intersection of arbitrary many monotonous class is again a monotonous class. Therefore, for all $\mathcal{E} \subset \mathcal{P}(\Omega)$ with $\mathcal{E} \neq \emptyset$ there exists the smallest monotonous class around \mathcal{E}

$$\mathcal{M}_{\mathcal{E}} := \bigcap_{\mathcal{M} \text{ is monotonous class, } \mathcal{E} \subset \mathcal{M}} \mathcal{M} \quad (1.7)$$

Remark. All σ -algebras are monotone class.

Theorem 1.7.1. Let $\mathcal{A} \subset \mathcal{P}(\Omega)$ an algebra of sets. Then, the following are equivalent

- \mathcal{A} is a σ -algebra.
- For $A_k \uparrow A$, $A \in \mathcal{A}$.

1.7 Product Algebra??

Definition 1.8. Let Ω_1 and Ω_2 be sets; let $\mathcal{R}_1 \subset \mathcal{P}(\Omega_1)$ and $\mathcal{R}_2 \subset \mathcal{P}(\Omega_2)$ be ring of sets, and $\Omega := \Omega_1 \times \Omega_2$. Define

$$\mathcal{R} := \mathcal{R}_1 \boxtimes \mathcal{R}_2 := \left\{ \bigcup_{i=1}^m A_i \times B_i \mid A_i \in \mathcal{R}_1, B_i \in \mathcal{R}_2, m \in \mathbb{N} \right\} \quad (1.8)$$

\mathcal{R} is a ring of sets over Ω .

Theorem 1.8.1. In above definition, if \mathcal{R}_1 and \mathcal{R}_2 are algebra of sets, then \mathcal{R} is a algebra of set.

Theorem 1.8.2.

$$\mathfrak{Q}(\mathbb{R}^n) \quad (1.9)$$

is a ring of sets.

Remark. From $\mathfrak{Q}(\mathbb{R}^n)$ we can construct one very important σ -algebra, the Borel-Algebra of \mathbb{R}^n .

Definition 1.9 (Products of σ -algebras). Let \mathcal{A}_1 and \mathcal{A}_2 be σ -algebras on Ω_1, Ω_2 . Then, let

$$\mathcal{A}_1 \otimes \mathcal{A}_2 = \sigma(\mathcal{A}_1 \boxtimes \mathcal{A}_2) \quad (1.10)$$

Example 1.9.1.

$$\mathcal{B}(\mathbb{R}^{n+m}) = \mathcal{B}(\mathbb{R}^n) \otimes \mathcal{B}(\mathbb{R}^m) \quad (1.11)$$

Definition 1.10. Let $(X_k)_{k \in \mathbb{N}^*}$ be a sequence of sets with $X_1 \subset X_2 \subset X_3 \subset \dots$ and $X := \lim_{k \rightarrow \infty} := \bigcup_{k \in \mathbb{N}^*} X_k$. Similar for monotonously decreasing.

1.8 Borel σ -algebra

Definition 1.11. Let Ω be a set. A collection $\mathcal{U} \subset \mathcal{P}(\Omega)$ of subsets of X is called a topology on X if it satisfies the following axioms.

1. $\emptyset, X \in \mathcal{U}$.
2. If $n \in \mathbb{N}$ and $U_1, \dots, U_n \in \mathcal{U}$ then $\bigcap_{i=1}^n U_i \in \mathcal{U}$.
3. If I is any index set and $U_i \in \mathcal{U}$ for $i \in I$ then $\bigcup_{i \in I} U_i \in \mathcal{U}$.

A topological space is a pair (Ω, \mathcal{U}) consisting of a set Ω and a topology $\mathcal{U} \in \mathcal{P}(\Omega)$.

Example 1.11.1 (Standard Topology on $\overline{\mathbb{R}}$). The set of open subsets \mathcal{T} of $\overline{\mathbb{R}}$ is the standard topology on $\overline{\mathbb{R}}$. Concretely, \mathcal{T} contains countable union of open intervals in \mathbb{R} and sets of the form $(a, \infty]$ or $[-\infty, b)$ for $a, b \in \mathbb{R}$.

Definition 1.12 (Borel algebra). Let (Ω, \mathcal{T}) be a topological space, then $\mathcal{B}(\Omega) := \sigma(\mathcal{T})$ is the Borel σ -algebra of Ω . The elements of \mathcal{B} are called Borel (measurable) sets. There are many ways to generate this algebra.

Theorem 1.12.1. Let (Ω, \mathcal{T}) be a topological space. Then the following holds.

1. Every closed subset $F \subset \Omega$ is a Borel set.
2. Every countable union $\bigcup_{i=1}^{\infty} F_i$ of closed subsets $F_i \subset \Omega$ is a Borel set.
3. Every countable intersection $\bigcap_{i=1}^{\infty} F_i$ of open subsets $F_i \subset \Omega$ is a Borel set.

Theorem 1.12.2. It is

$$\mathcal{B}(\mathbb{R}^n) = \sigma(\mathfrak{Q}(\mathbb{R}^n)) \quad (1.12)$$

Moreover, define

$$\mathfrak{Q}_{\mathbb{Q}}(\mathbb{R}^n) := \left\{ \bigcup_{i=1}^m [a_{1,i}, b_{1,i}) \times \dots [a_{n,i}, b_{n,i}) \mid m \in \mathbb{N}; a_{\nu,i}, b_{\nu,i} \in \mathbb{Q}; \nu = 1, \dots, n \right\} \quad (1.13)$$

the ring of sets of finite unions of quadern with rational edge points. Then, we even have

$$\mathcal{R}(\mathbb{R}^n) = \sigma(\mathfrak{Q}_{\mathbb{Q}}(\mathbb{R}^n)) \quad (1.14)$$

Lemma 1.12.1. Open subsets $U \subset \mathbb{R}^n$ are disjoint union of countably many right half open dices with edge points in \mathbb{Q}^n

1.9 Exercises

Chapter 2

Measure

Definition 2.1. Let $\mathcal{R} \subset \mathcal{P}(\Omega)$ a ring of sets, and let $\mu : \mathcal{R} \rightarrow [0, \infty]$ be an application. μ is called a content, if

1. $\mu(\emptyset) = 0$.
2. $\mu(A \dot{\cup} B) = \mu(A) + \mu(B)$

An σ -additive content is called premeasure.

A premeasure $\mu : \mathcal{A} \rightarrow [0, \infty]$ on σ -algebra \mathcal{A} is called a measure.

μ is finite if for all $A \in \mathcal{R} : \mu(A) < \infty$.

μ is σ -finite if there exists a sequence $(A_m)_{m \in \mathbb{N}^*}$ in \mathcal{R} with $\mu(A_m) < \infty$ and $\bigcup_{m \in \mathbb{N}^*} A_m = \Omega$.

Lemma 2.1.1. If $\mu(A \cap B) < \infty$, then

$$\mu(A \cap B) = \mu(A) + \mu(B) - \mu(A \cup B) \quad (2.1)$$

Theorem 2.1.1 (Properties of premeasure).

Example 2.1.1 (Dirac-measure). Let $\Omega \neq \emptyset$. Let $\mathcal{A} \subset \mathcal{P}(\Omega)$ a σ -algebra. Define for all $x \in \Omega$ a $\delta_x : \mathcal{A} \rightarrow \mathbb{R}_0^+$ with

$$\delta_x(A) := \begin{cases} 1, & \text{if } x \in A \\ 0, & \text{else.} \end{cases} \quad (2.2)$$

δ_x is a finite measure, called the Dirac-measure.

Definition 2.2. Let

$$\mathfrak{Q}(\mathbb{R}^n) := \left\{ \bigcup_{i=1}^m [a_{1,i}, b_{1,i}) \times \dots \times [a_{n,i}, b_{n,i}) \mid m \in \mathbb{N}; a_{\nu,i}, b_{\nu,i} \in \mathbb{R}; \nu = 1, \dots, n \right\} \quad (2.3)$$

define

$$\lambda^n : \mathfrak{Q}(\mathbb{R}^n) \rightarrow \mathbb{R}_0^+, A \mapsto \lambda^n(A) := \sum_{i=1}^m \prod_{\nu=1}^n (b_{\nu,i} - a_{\nu,i}) \quad (2.4)$$

is a premeasure.

Definition 2.3.

$$\mathcal{R}^\uparrow := \{A \in \mathcal{P}(\Omega) \mid \exists (A_k)_{k \in \mathbb{N}^*} \subset \mathcal{R} \text{ with } A_k \uparrow A\} \quad (2.5)$$

\mathcal{R}^\uparrow is the set of all $A \in \mathcal{P}(\Omega)$ that can be expressed as countably many sets from \mathcal{R} . \mathcal{R}^\uparrow is not a ring of sets.

Definition 2.4. Let $\mu : \mathcal{R} \rightarrow [0, \infty]$ be a premeasure on \mathcal{R} , and $A_k \uparrow A$. Then,

$$\tilde{\mu} : \mathcal{R}^\uparrow \rightarrow [0, \infty], A \mapsto \tilde{\mu}(A) = \lim_{k \rightarrow \infty} \mu(A_k) \quad (2.6)$$

is an extension of μ on \mathcal{R}^\uparrow . This is not in general a premeasure.

Theorem 2.4.1 (Properties of the first extension).

Definition 2.5. Let $\mathcal{R} \subset \mathcal{P}(\Omega)$ a set of rings, $\mu : \mathcal{R} \rightarrow [0, \infty]$ a σ -finite premeasure on \mathcal{R} , and $\tilde{\mu} : \mathcal{R}^\uparrow \rightarrow [0, \infty]$ the first extension on \mathcal{R}^\uparrow . Moreover, let $X \subset \Omega$ a subset of Ω . Then,

$$\mu^* : \mathcal{P}(\Omega) \rightarrow [0, \infty], X \mapsto \mu^*(X) := \inf \{ \tilde{\mu}(A) \mid A \in \mathcal{R}^\uparrow, X \subset A \} \quad (2.7)$$

is the outer measure.

Theorem 2.5.1 (Properties of the second extension).

Bla Bla bla

Definition 2.6 (Lebesgue measure).

Part II

Lebesgue Integral

Chapter 3

Measurable Functions

Definition 3.1 (Measurable Function). Let (X, \mathcal{A}_X) and (Y, \mathcal{A}_Y) be measurable spaces. A map $f : X \rightarrow Y$ is called measurable if the pre-image of every measurable subset of Y under f is measurable subset of X , i.e.

$$B \in \mathcal{A}_Y \Rightarrow f^{-1}(B) \in \mathcal{A}_X. \quad (3.1)$$

Definition 3.2. Let (X, \mathcal{A}_X) be a measurable space. A function $f : \Omega \rightarrow \overline{\mathbb{R}}$ is called measurable if it is measurable with respect to the Borel σ -algebra on $\overline{\mathbb{R}}$

Definition 3.3 (Borel Measurable Maps).

Theorem 3.3.1. Let (Ω, \mathcal{A}) be a measurable space, and $\mathcal{B} = \sigma(\mathcal{E})$ for a generator $\mathcal{E} \subset \mathcal{P}(\Omega)$. If for all $E \in \mathcal{E}$ it is $f^{-1}(E) \in \mathcal{A}$, then f is measurable.

Example 3.3.1. Let $f : (\mathbb{R}, \mathcal{B}) \rightarrow (\mathbb{R}, \mathcal{B})$ defined as

$$f(x) := \begin{cases} 1 & x \in Q \\ -1 & x \notin Q \end{cases} \quad (3.2)$$

for a $Q \notin \mathcal{B}(\mathbb{R})$. Then, $f^{-1}(1) = Q \notin \mathcal{B}$ and therefore, f is not measurable even though $|f| = 1$ is measurable.

Chapter 4

Convergence Theorems

Theorem 4.0.1 (Beppo Levi). Let $(\Omega, \mathcal{A}, \mu)$ a measure space, and for $k \in \mathbb{N}^*$, let $f_k : \Omega \rightarrow \mathbb{R}$ be a sequence of integrable functions such that

$$\forall x \in \Omega, \forall n \in \mathbb{N} : f_n(x) \leq f_{n+1}(x). \quad (4.1)$$

Moreover, if there exists $M \in \mathbb{R}$ with $\forall k : \int f_k d\mu \leq M$, then

$$f := \lim_{k \rightarrow \infty} f_k : \Omega \rightarrow \overline{\mathbb{R}} \quad (4.2)$$

integrable with

$$\int f d\mu = \lim_{k \rightarrow \infty} \int f_k d\mu \quad (4.3)$$

Theorem 4.0.2. If the Riemann integral exists, it matches the Lebesgue integral.

Theorem 4.0.3. Let $(\Omega, \mathcal{A}, \mu)$ a measure space, let $g : X \rightarrow [0, \infty)$ be an integrable function, and let $f_n : X \rightarrow \mathbb{R}$ be a sequence of integrable functions satisfying

$$|f_n(x)| \leq g(x) \text{ for all } x \in X \text{ and } n \in \mathbb{N} \quad (4.4)$$

and converging pointwise to $f : X \rightarrow \mathbb{R}$. Then f is integrable and, for every $E \in \mathcal{A}$

$$\int_E f d\mu = \lim_{n \rightarrow \infty} \int_E f_n d\mu \quad (4.5)$$

Part III

Applications

Chapter 5

Cavalieri's Principle

Definition 5.1 (Cross-section). Let $\mathbb{R}^n = \mathbb{R}^k \times \mathbb{R}^l$ with $n, k, l \in \mathbb{N}^*$, and $A \subset \mathbb{R}^n$. Then for a $y \in \mathbb{R}^l$

$$A_y := \{x \in \mathbb{R}^k \mid (x, y) \in A\} \quad (5.1)$$

is the l -dimensional cross-sections of A .

Remark. Immediately from the definition above, we have

$$A = \bigcup_{y \in \mathbb{R}^l} (A_y, y). \quad (5.2)$$

In other words, $\{(A_y, y)\}_{y \in \mathbb{R}^l}$ is a patition of A .

Theorem 5.1.1 (Cavalieri's principle). Let $\mathbb{R}^n = \mathbb{R}^k \times \mathbb{R}^l$ with $n, k, l \in \mathbb{N}^*$, let $A \subset \mathbb{R}^k \times \mathbb{R}^l$ a Borel subset of \mathbb{R}^n , and let $\{(A_y, y)\}_{y \in \mathbb{R}^l}$ be a patition of A via cross-sections. Then we have the following

1. For all $y \in \mathbb{R}^l$, A_y is Borel subset of \mathbb{R}^k .
2. Let $F_A : \mathbb{R}^l \rightarrow [0, \infty]$, $y \mapsto F_A(y) := \text{Vol}_K(A_y) = \lambda^k(A_y)$ be the k -dimensional volume of A_y . Then F_A is Borel measurable on \mathbb{R}^l .
3. $\text{Vol}_n(A) := \int_{\mathbb{R}^l} \text{Vol}_k(A_y)$

Proof. 1. Fix $y \in \mathbb{R}^l$

Theorem 5.1.2. For $K \subset \mathbb{R}^\times$ compact, we have

$$\text{Vol}_n(K) = \int_{\mathbb{R}} \text{Vol}_{n-1}(K_t) \quad (5.3)$$

Chapter 6

Finding Volume by Rotation

Definition 6.1. $F : \mathbb{R}^n \rightarrow \overline{\mathbb{R}}$ is rotationally symmetric in \mathbb{R}^n if there exists a $f : [0, \infty) \rightarrow \overline{\mathbb{R}}$ such that for all $x \in \mathbb{R}^n$ it is $F(x) = f(\|x\|)$.

Theorem 6.1.1. The volume of the unit sphere is

$$\tau_n = \frac{\pi^{\frac{n}{2}}}{\Gamma(\frac{n}{2} + 1)} \quad (6.1)$$

Theorem 6.1.2. Let $B \subset [0, \infty)$ a Borel subset and $A := \{x \in \mathbb{R}^n \mid \|x\| \in B\}$. Then the Lebesgue measure of A is

$$\lambda^n(A) = n\tau_n \int_B r^{n-1} dr \quad (6.2)$$

where τ_n is the volume of the unit sphere.

Theorem 6.1.3. Let $f : [0, \infty) \rightarrow \overline{\mathbb{R}}$ is Borel measurable. Then the following are equivalent.

1. $F : \mathbb{R}^n \rightarrow \overline{\mathbb{R}}, x \mapsto F(x) := f(\|x\|)$ is Lebesgue integrable over \mathbb{R}^n .
2. $r^{n-1}f : [0, \infty) \rightarrow \overline{\mathbb{R}}, r \mapsto r^{n-1}f(r)$ is Lebesgue integrable over $[0, \infty)$.

Moreover, if one of the above is true, then we have the formula

$$\int_{\mathbb{R}^n} f(\|x\|) d^n x = n\tau_n \int_{[0, \infty)} r^{n-1} f(r) dr \quad (6.3)$$

Example 6.1.1. For a $R \in \mathbb{R}^+$ and $1 \leq i \leq n$ let

$$I_i := \int_{\|x\| \leq R} x_i^2 d^n x. \quad (6.4)$$

We immediately have $I_i = I_j =: I$ for all i, j .

$$I = \frac{1}{n} \sum_{i=1}^n I_i \quad (6.5)$$

$$= \frac{1}{n} \sum_{i=1}^n \int_{\|x\| \leq R} x_i^2 d^n x \quad (6.6)$$

$$= \frac{1}{n} \int_{\|x\| \leq R} \sum_{i=1}^n x_i^2 d^n x \quad (6.7)$$

$$= \frac{1}{n} \int_{\|x\| \leq R} \|x\|^2 d^n x \quad (6.8)$$

$$(6.9)$$

Now with the formula above, we have

$$I = \frac{1}{n} \cdot n \cdot \tau_n \int_0^R r^{n-1} r^2 dr \quad (6.10)$$

$$= \tau_n \int_0^R r^{n+1} dr \quad (6.11)$$

$$= \tau_n \frac{R^{n+2}}{n+2} \quad (6.12)$$

Example 6.1.2.

$$\int_0^\infty \exp(-x^2) = \frac{\sqrt{\pi}}{2} \quad (6.13)$$

Proof. Define

$$I = \int_{-\infty}^\infty \exp(-x^2) dx \quad (6.14)$$

Consider

$$I^2 = \left(\int_{-\infty}^\infty \exp(-x^2) dx \right) \left(\int_{-\infty}^\infty \exp(-y^2) dy \right) \quad (6.15)$$

$$= \int_{-\infty}^\infty \int_{-\infty}^\infty \exp(-x^2) \exp(-y^2) dx dy \quad (6.16)$$

$$= \int_{-\infty}^\infty \int_{-\infty}^\infty \exp(-(x^2 + y^2)) dx dy \quad (6.17)$$

$$= \int_{\mathbb{R}^2} e^{-\|x\|^2} d^2 \lambda \quad (6.18)$$

$$= \int_0^\infty r e^{-r^2} dr \quad (6.19)$$

Example 6.1.3. Let $B_1 := \{x \in \mathbb{R}^2 \mid \|x\| < 1\}$ be the open unit disk. Find the integral

$$\int_{B_1} \frac{1}{\sqrt{1 - \|x\|^2}} d\lambda^2(x) \quad (6.20)$$

Proof. Define $f : [0, \infty) \rightarrow \overline{\mathbb{R}}$ as

$$f(x) = \frac{1}{\sqrt{1 - x^2}} \chi_{[0,1)}(x). \quad (6.21)$$

As $[0, 1)$ is a Borel set of \mathbb{R} , $\chi_{[0,1)}$ is Borel measurable. On the other hand, $\frac{1}{\sqrt{1-x^2}}$ is continuous for all $x \in [0, 1)$, so the composition of these two functions f is again Borel measurable.

Now consider, $rf(r)$. We have

$$\int |rf(r)| dr = \int_0^1 \frac{r}{\sqrt{1-r^2}} dr \quad (6.22)$$

$$= -\sqrt{1-r^2} \quad (6.23)$$

$$= 0 + 1 \quad (6.24)$$

$$= 1 \quad (6.25)$$

Example 6.1.4. Compute the following integral

$$f(\xi, \eta) := \int_{B_1} \frac{\exp(i(x\xi + y\eta))}{\sqrt{1 - x^2 - y^2}} dx dy \quad (6.26)$$

Chapter 7

Transformation Formula

Theorem 7.0.1. Suppose $\phi : U \rightarrow V$ is a C^1 -diffeomorphism between open subsets of \mathbb{R}^n . If $f : V \rightarrow \mathbb{R}$ is Lebesgue integrable OR continuous with a compact support, then

$$\int_U (f \circ \phi) |\det(d\phi)| dm = \int_V f dm. \quad (7.1)$$

Example 7.0.1. (2D) From polar coordinates to cartesian coordinates.

$$\phi : \mathbb{R}_0^+ \times [0, 2\pi) \rightarrow \mathbb{R}^2, (r, \varphi) \mapsto \phi(r, \varphi) := (r \cos \varphi, r \sin \varphi) \quad (7.2)$$

$$D\phi(r, \varphi) = \begin{pmatrix} \cos \varphi & -r \sin \varphi \\ \sin \varphi & r \cos \varphi \end{pmatrix} \quad (7.3)$$

$$\det D\phi(r, \varphi) = r \quad (7.4)$$

(3D) From spherical coordinates to cartesian coordinates.

$$\phi : \mathbb{R}_0^+ \times [0, \pi] \times [0, 2\pi) \rightarrow \mathbb{R}^3 \quad (7.5)$$

$$(r, \theta, \varphi) \mapsto \phi(r, \theta, \varphi) := (r \sin \theta \cos \varphi, r \sin \theta \sin \varphi, r \cos \theta) \quad (7.6)$$

$$D\phi(r, \theta, \varphi) := \begin{pmatrix} \sin \theta \cos \varphi & r \cos \theta \cos \varphi & -r \sin \theta \sin \varphi \\ \sin \theta \sin \varphi & r \cos \theta \sin \varphi & r \sin \theta \cos \varphi \\ \cos \theta & -r \sin \theta & 0 \end{pmatrix} \quad (7.7)$$

$$\det D\phi(r, \theta, \varphi) = r^2 \sin \theta \quad (7.8)$$

(3D) From cylindrical coordinates to cartesian coordinates.

$$\phi : \mathbb{R} \times \mathbb{R} \times [0, 2\pi) \rightarrow \mathbb{R}^3 \quad (7.9)$$

$$x = r \cos \theta \quad (7.10)$$

$$y = r \sin \theta \quad (7.11)$$

$$z = z \quad (7.12)$$

$$D\phi(r, \theta, z) = \begin{pmatrix} \cos \theta & -r \sin \theta & 0 \\ \sin \theta & r \cos \theta & 0 \\ 0 & 0 & 1 \end{pmatrix} \quad (7.13)$$

$$\det D\phi(r, \theta, z) = r \quad (7.14)$$

Chapter 8

Lebesgue Space

Definition 8.1 (L^p -Norm). Let X, \mathcal{A}, μ a measure space, and $f : X \rightarrow \overline{\mathbb{R}}$ measurable. Then for $p \in [1, \infty)$ the L^p -norm is defined as

$$\|f\|_p := \left(\int_X |f|^p d\mu \right)^{\frac{1}{p}}. \quad (8.1)$$

Theorem 8.1.1 (Holder Inequality). Let $p, q \in (1, \infty)$ such that $p^{-1} + q^{-1} = 1$. Let $f, g : X \rightarrow \overline{\mathbb{R}}$ measurable. Then we have

$$\|fg\|_1 \leq \|f\|_p \cdot \|g\|_q \quad (8.2)$$

Theorem 8.1.2 (Minkowski Inequality). Let $f, g : X \rightarrow \overline{\mathbb{R}}$ measurable and $f + g$ well defined on X . Then

$$\forall p \in [1, \infty) : \|f + g\|_p \leq \|f\|_p + \|g\|_p \quad (8.3)$$

Definition 8.2. Let X, \mathcal{A}, μ be a measure space and $p \in [1, \infty)$. Define

$$\mathcal{L}^p(X, \mathcal{A}, \mu) = \left\{ f : X \rightarrow \overline{\mathbb{R}} \mid f \text{ is } \mathcal{A}\text{-measurable and } \|f\|_p < \infty \right\} \quad (8.4)$$

Part V

Manifolds

Definition 8.3. $M \subset \mathbb{R}^n$ is a k -dimensional submanifold, if

- For all $a \in M$ there exists an open neighbourhood U around a in \mathbb{R}^n and there exists a $n - k$ continuously partial differentiable $f_j : U \rightarrow \mathbb{R}$ for $j = 1, \dots, n - k$ such that

$$M \cap U = \{x \in U \mid f_1(x) = \dots = f_{n-k}(x) = 0\} \quad (8.5)$$

and for all $x \in U$

$$\text{rank} \frac{\partial(f_1, \dots, f_{n-k})}{\partial(x_1, \dots, x_n)}(x) = n - k \quad (8.6)$$

Example 8.3.1. Let's construct the simplest submanifold. Let $n = 2$ and $k = 1$.

$$M = \{x \in \mathbb{R}^2 \mid f(x, y) = c\} \quad (8.7)$$

Theorem 8.3.1. If $M \subset \mathbb{R}^n$ is a k -dimensional submanifold then the following are equivalent.

1. For all points $a \in M$ there exists a open neighbourhood $U \in \mathcal{U}_a(\mathbb{R})$, and there exists a function $f_i : U \rightarrow \mathbb{R}$ with $1 \leq i \leq n - k$ that is $n - k$ continuously (partially) differentiable such that

$$M \cap U = \{x \in U \mid f_1(x) = \dots = f_{n-k}(x) = 0\} \quad (8.8)$$

and for all $x \in U$ $Df(x) = n - k$.

Example 8.3.2. The figure eight is described by $f : \mathbb{R} \rightarrow \mathbb{R}^2$, $f(t) := (\cos t, \sin 2t)$. Define

$$M := \{x \in \mathbb{R} \mid \cos x = 0, \sin 2x = 0\} \quad (8.9)$$

then

$$D\phi(x) = \begin{pmatrix} -\sin t \\ 2 \cos 2t \end{pmatrix} \quad (8.10)$$

Definition 8.4. A submanifold is k -dimensional of the class \mathcal{C}^α if the $n - k$ functions that describe the submanifold is α times continuously differentiable.

Theorem 8.4.1. Let $M \subset \mathbb{R}^n$ a k -dimensional submanifold of the class \mathcal{C}^α . Let $i = 1, 2$ $T_i \subset \mathbb{R}^k$ open and $\varphi_i : T_i \rightarrow V_i \subset M$ KARTEN, i.e. in parameter form of the class \mathcal{C}^α with $V := V_1 \cap V_2 \neq \emptyset$.

Exercise 8.1

Let $f, g : \mathbb{R}^3 \rightarrow \mathbb{R}$ defined as

$$f(x, y, z) := x^2 + xy - y - z \quad g(x, y, z) := 2x^2 + 3xy - 2y - 3z \quad (8.11)$$

Show that

$$C := \{(x, y, z) \in \mathbb{R}^3 \mid f(x, y, z) = g(x, y, z) = 0\} \quad (8.12)$$

is a submanifold of \mathbb{R}^3 and that

$$\phi : \mathbb{R} \rightarrow \mathbb{R}^3, \phi(t) := (t, t^2, t^3) \quad (8.13)$$

is a global parametrization of C .

Solution 8.1

Define $F : \mathbb{R}^3 \rightarrow \mathbb{R}^2$ as $F(x, y, z) = (f(x, y, z), g(x, y, z))$, then C can be rewritten as

$$C = \{(x, y, z) \in \mathbb{R}^3 \mid F(x, y, z) = 0\}. \quad (8.14)$$

We have

$$\partial_x f(x, y, z) = 2x + y \quad \partial_x g(x, y, z) = 4x + 3y \quad (8.15)$$

$$\partial_y f(x, y, z) = x - 1 \quad \partial_y g(x, y, z) = 3x - 2 \quad (8.16)$$

$$\partial_z f(x, y, z) = -1 \quad \partial_z g(x, y, z) = -3 \quad (8.17)$$

therefore

$$DF(x, y, z) = \begin{pmatrix} 2x + y & x - 1 & -1 \\ 4x + 3y & 3x - 2 & -3 \end{pmatrix} \quad (8.18)$$

To check if DF surjective, it is enough to show that

$$\begin{pmatrix} x - 1 \\ 3x - 2 \end{pmatrix} \begin{pmatrix} -1 \\ -3 \end{pmatrix} \quad (8.19)$$

are linearly independent. For that, we compute the determinant of the matrix created by the two vectors.

$$\det \begin{pmatrix} x - 1 & -1 \\ 3x - 2 & -3 \end{pmatrix} = -3x + 3 + 3x - 2 = 1 \quad (8.20)$$

So, DF has a rank of 2, therefore surjective. With this, C is a submanifold of \mathbb{R}^3 .
