

Definition 0.1 — .

An ideal q in A is primary if $q \neq A$ and if

$$xy \in q \Rightarrow \text{either } x \in q \text{ or } y^n \in q \text{ for some } n > 0 \quad (1)$$

Proposition 1. q is primary $\iff A/q \neq 0$ and every zero-divisor in A/q is nilpotent

Proof. Let q be a primary ideal.

1. Let $x \in A/q$ be a zero-divisor, then there is a $y \in A/q$ such that $(x + q)(y + q) = xy + q = \bar{0}$.
2. So $xy \in q$ and by definition, we either have $x \in q$ or $y^n \in q$ for some $n > 0$.
3. $x \in q$ and $y \in q$ cannot be, because we required x to be a zero-divisor in A/q .
4. The only other option is $x^n = 0$ for some $n > 0$.
5. Hence, x is nilpotent in A/q .

□

Proposition 2. Every prime ideal is primary.

Proposition 3. Contraction of primary ideals are primary.

Proposition 4. Let q be a primary ideal in a ring A . Then \sqrt{q} is the smallest prime ideal containing q .

Proof. The nilradical of A is the intersection of all the prime ideals of A .
