My notes on "The Strong Factorial Conjecture" by Eric Edo and Arno van den Essen.
See: https://arxiv.org/abs/1304.3956

1 Factorial Conjecture

$\mathbb{C}^{[m]}$ may be viewed as a vecor space over $\mathbb{C}$ with a basis being

$$\left\{ X_1^{l_1} \cdots X_m^{l_m} \;\middle|\; l_k \in \mathbb{N}_0 \text{ for all } 1 \le k \le m \right\}.$$

Thus any linear map is fully defined if we set a value for each basis element. Such linear map is the factorial map.

Definition 1. A factorial map is a linear map linear map $\mathcal{L} : \mathbb{C}^{[m]} \longrightarrow \mathbb{C}$ defined by

$$\mathcal{L}(X_1^{l_1} \cdots X_m^{l_m}) = l_1! \cdots l_m! \qquad \text{for all } l_1, \ldots, l_m \in \mathbb{N}$$

Example 1.1. Consider $f(X) = 3X - 5XY + 7Y^2 \in \mathbb{C}^{[2]}$. Applying the factorial map yields

$$\begin{aligned} \mathcal{L}(f(X)) &= 3\mathcal{L}(X) - 5\mathcal{L}(XY) + 7\mathcal{L}(Y^2) \\ &= 3 \cdot 1 - 5 \cdot 1 + 7 \cdot 2 \\ &= 12. \end{aligned}$$

Example 1.2. If we limit our selves to a polynomial with one indeterminate, such as $f(X) = \sum_{k=0}^{n} a_k X^k \in \mathbb{C}[X]$ for a fixed $n \in \mathbb{N}_0$, we have

$$\mathcal{L}(f(X)) = \sum_{k=0}^{n} a_k \mathcal{L}(X^k) = \sum_{k=0}^{n} a_k k!$$

Theorem 2 (Conjecture 2.4)**.** Let $f \in \mathbb{C}^{[m]}$ be a polynomial. We have $\mathcal{L}(f^k) = 0$ for all $k \in \mathbb{N}_+$ if and only if $f = 0$.

Remark. The converse is trivial, hence the conjecture is about the forward implication.

2 Rigidity Conjecture

When we consider compositions of formal power series, we always want the constant term to be 0.

The following example is taken from:

https://math.stackexchange.com/questions/1212053/defining-composition-of-two-formal-series-what-is-going-on

Example 2.1. Let $f = \sum_{k \in \mathbb{N}_0} a_k X^k$ and $g = 1 + X$. Consider $f \circ g$. We have

$$\begin{aligned} f \circ g &= \sum_{k \in \mathbb{N}_0} a_k (1 + X)^k \\ &= a_0 + a_1 + a_1 X + a_2 + 2a_2 X + a_2 X^2 + \cdots \end{aligned}$$

If $f \circ g$ is again a formal power series, then we should be able to write $f \circ g = \sum_{k \in \mathbb{N}_+} c_k X^k$ for some $c_k \in \mathbb{C}$. However, we see that c_0 is the sum of all a_k and we cannot evaluate that as algebraists. Thus composition of formal power series only makes sense if the constant coefficient is 0.

Proposition 3. A power series $f(X) = \sum_{k \in \mathbb{N}_+} a_k X^k \in \mathbb{C}[[X]]$ has a compositional inverse $f^{-1}(X)$ if and only if $a_1 \neq 0$, in which case $f^{-1}(X)$ is unique.

Proof. Let $g(X) = b_1 X + b_2 X^2 + \cdots \in \mathbb{C}[[X]]$ be some power series that satisfies $f(g(X)) = X$. We have

$$\begin{aligned} X =& a_1(b_0 + b_1 X + b_2 X^2 + \cdots) + a_2(b_0 + b_1 X + b_2 X^2 + \cdots)^2 + \cdots && (1) \\ =& a_1 b_0 + a_2 b_0 + \cdots + && (2) \\ & a_1 b_1 X && (3) \end{aligned}$$

$\square$

Theorem 4 (Conjecture 2.13)**.** Let $a(X) \in \mathbb{C}[X]$ be a polynomial of degree less or equal to $m+1 \in \mathbb{N}_+$ such that $a(X) \equiv X \mod X^2$. If the first m consecutive coefficient of the compositional inverse $a^{-1}(X)$ vanish, then $a(X) = X$.

Theorem 5 (Conjecture 2.14)**.** Let $a(X) \in \mathbb{C}[X]$ be a polynomial of degree less or equal to $m+1 \in \mathbb{N}_+$ such that $a(X) \equiv X \mod X^2$. If the coefficients of $X^{n+1}, \ldots, X^{n+m}$ of the compositional inverse vanish, then $a(X) = X$.

Remark. $R(m)$ if and only if $R(m)_n$ for all $n \in \mathbb{N}_+$.

Proof. Let $R(m)$ be true for a $m \in \mathbb{N}_0$.

Then $R(m)_1$ is true, i.e. if $\deg(a) \leq m+1$ and if the □

Remark. If we denote the polynomial $a(X)$ by $\sum_{k \in \mathbb{N}_0} a_k X^k$ for some $a_k \in \mathbb{C}$ for all $k \in \mathbb{N}_0$, then the condition $a(X) \equiv X \mod X^2$ amounts to $a_0 = 0$ and $a_1 = 1$.

Moreover, we have this:

A power series has a compositional inverse if and only if $a_1 \neq 0$. In that case, the inverse is unique.

https://math.stackexchange.com/questions/2520744/finding-compositional-inverses-for-formal-power-series

My questions:

1. What if $a_0 \neq 0$? Pick $a_0 = 3$.

   Let $f \in \mathbb{C}[X]$ be a polynomial with $a_0 \neq 0$. Then we may write $f(X) = g(X) + a_0$ where g has a compositional inverse. Thus it it

$$\begin{aligned} g^{-1}(g(X) + a_0) &= g^{-1}(g(X)) + g^{-1}(a_0) \\ &= X + g^{-1}(a_0) \end{aligned}$$

$$\begin{aligned} h(X) &= g^{-1}(X) + g^{-1}(a_0) \\ h(f(X)) &= h(g(X) + a_0) \\ &= g^{-1}(g(X) + a_0) + g^{-1}(a_0) \\ &= X \end{aligned}$$

   Let $f \in \mathbb{C}[X]$ be a polynomial with $a_1 \neq 1$ and $a_1 \neq 0$. Then we may write $f(X) =$

https://www.math.uwaterloo.ca/ dgwagner/co430I.pdf

proof

Proposition 6. 1. The polynomial $a(X)$ is invertible for the composition.

2. For all $i \in \{1, \ldots, \deg(a-1)\}$, the coefficient a_i is nilpotent element in A. I just don't see this ...

Lemma 7 (Lagrange Inversion Formula)**.** Let K be a field of charateristic

Example 7.1 (See 5.4.4)**.** $f(X) = Xe^{-X} = X \sum_{k=0}^{\infty} \frac{(-1)^k}{k!} X^k$

$$[X^n] f^{-1}(X) = \frac{1}{n} [X^{n-1}] e^{nX}$$

Lemma 8 (Lemma 2.20 (Additive Inversion Formula))**.** Let $\alpha_1, \ldots, \alpha_m \in \mathbb{C}$ be complex numbers. The formal inverse of $a(X) = X(1 - (\alpha_1 X + \cdots + \alpha_m X^m))$ is given by the following formula

$$a^{-1}(X) = X\left(1 + \frac{1}{n+1}\sum_{n\geq 1} u_n X^n\right)$$

where

$$u_n = \frac{1}{n!}\sum_{j_1+2j_2+\cdots+mj_m=n} \frac{(n+j_1+\cdots+j_m)!}{j_1!\cdots j_m!}\alpha_1^{j_1}\cdots\alpha_m^{j_m}$$

Proposition 9 (Proposition 2.23)**.** Let $\alpha_1, \ldots, \alpha_m \in \mathbb{C}$ be complex numbers and let $(u_n)_{n\in\mathbb{N}_+}$ be a sequence defined by AIF in Lemma 2.20. For all $n \in \mathbb{N}_+$, the Rigidity Conjecture $R(m)_n$ is equivalent to the following implication: If $u_n = \cdots = u_{n+m-1} = 0$ then $\alpha_1 = \cdots = \alpha_m = 0$.

Proof. □

Theorem 10. 1. The inclusion $E^{[m]} \subset F_n^{[m]}$ implies $R(m)_n$

Definition 11.

$$\begin{aligned}
E^{[m]} &= \{\, X_1\cdots X_m(\mu_1 X_1 + \cdots + \mu_m X_m) \mid \mu_1, \ldots, \mu_m \in \mathbb{C} \,\} \subset \\
F_n^{[m]} &= \left\{ f \in \mathbb{C}^{[m]} \setminus \{0\} \;\middle|\; \mathcal{L}(f^k) \neq 0 \text{ for some } n \leq k \leq \mathcal{N}(f) - 1 \right\} \cup \{0\}
\end{aligned}$$
